Correction in app.py->

- Actually Only GET Method is available in the app.py , So I have changed it to both methods as the app will check both GET and POST methods

- To accept the both methods in one single end point instead of 2 end points , I have Put the condition statement in the function in which if statement takes when the POST method is executed and GET method is executed if else statement is executed.

- User put the string by form, so here modify the request.form

- When user write some new note app will take POST action, instead of by default action GET I have used the POST action

- For post method we have to use form instead of args so , I have changed args to form.

Correction in home.html->

- Add the suitable title for understanding the note taking app. This is not bug but change the title here for good understanding.
- Mention the path
- In the form tag give the app path as an action
- Mention the method Mention the method="POST" because app will listen the post request.
